Amendments to the Claims

- 1. (Canceled)
- 2. (Previously Amended) A differential amplifier, comprising:
 - a differential input capable of receiving a differential signal;
 - a first differential pair coupled to said differential input;
- a second differential pair, coupled to said differential input, and connected in parallel with said first differential pair at a differential output;
- a differential offset circuit, coupled between said differential input and said second differential pair, and capable of level shifting said differential signal from a first level to a second level; and
- a differential switch circuit, coupled to said first differential pair and said second differential pair, and capable of controlling a first current flow to said first differential pair and a second current flow to said second differential pair.
- 3. (Canceled)
- 4. (Canceled)
- 5. (Original) A differential amplifier, comprising:
 - a differential input capable of receiving a differential signal;
 - a first differential pair coupled to said differential input;

a second differential pair, coupled to said differential input, and connected in parallel with said first differential pair at a differential output; and

a differential switch circuit, coupled to said first differential pair and said second differential pair, and capable of controlling a first current flow to said first differential pair and a second current flow to said second differential pair.

6. (Original) The differential amplifier of claim 5, further comprising:

a differential offset circuit, coupled between said differential input and said second differential pair, and capable of level shifting said differential input signal from a first level to a second level.

- 7. (Original) The differential amplifier of claim 5, wherein said differential switch circuit comprises:
- a first switch MOSFET coupled between said first differential pair and a current source; and

a second switch MOSFET coupled between said second differential pair and said current source.

8. (Original) A differential amplifier, comprising:

- a differential input capable of receiving a differential input signal;
- a first differential pair coupled to said first differential input, said first differential pair biased with a first power supply voltage and a second power supply voltage;
- a second differential pair, coupled to said differential input, and connected in parallel with said first differential pair at a differential output, said second differential

pair biased with said first power supply voltage and said second power supply voltage; and

a differential switch circuit, coupled to said first differential pair and said second differential pair, and capable of controlling a first current flow to said first differential pair and a second current flow to said second differential pair.

- 9. (Original) The differential amplifier of claim 8, wherein said differential switch circuit changes said first current flow relative to said second current flow, based on a comparison between a common mode voltage of said differential input signal and a reference voltage.
- 10. (Original) The differential amplifier of claim 8, wherein said differential switch circuit increases said first current flow relative to said second current flow, when a common mode voltage of said differential input signal approaches said first power supply voltage.
- 11. (Original) The differential amplifier of claim 8, wherein said differential switch circuit decreases said first current flow relative to said second current flow, when a common mode voltage of said differential input signal approaches said second power supply voltage.
- 12. (Canceled)
- 13. (Canceled)

- 14. (Canceled)
 15. (Canceled)
 16. (Canceled)
 17. (Canceled)
 18. (Canceled)
 19. (Currently Amended) A method of extending an input signal range of a component
 - (1) level shifting a voltage of the input signal;

that receives the input signal, comprising the step of:

- (2) processing said level shifted voltage within the component; and
- (3) selecting a subcomponent, from a plurality of subcomponents within the component, to process said offset level shifted voltage.
- 20. (Currently Amended) The A method of claim 19, wherein step (3) comprises extending an input signal range of a component that receives the input signal, comprising the step steps of:
 - (1) level shifting a voltage of the input signal;
 - (2) processing said level shifted voltage within the component; and

- (3) responding to a comparison between a common mode voltage of the input signal and a reference voltage to select said a subcomponent from said a plurality of subcomponent's within the component to process said offset level shifted voltage.
- 21. (Previously Presented) The method of claim 19, wherein step (2) comprises the step of:

amplifying said level shifted voltage within the component.
